CECS 174 – Extra Credit #4 – 15 points

Create an Applet that displays a Histogram of the different outcomes of a pair of dice
1. Use a text box to instruct the user to input the number of throws of a dice
2. A pair of dice will be rolled that number of times. Count the number of each of the different outcomes of the roll of two dice.
3. Clicking the Roll button will cause the "normalized" histogram to be plotted.

Place your applet on a web page, email me the link, and print out your code.
